Ward DT, Dobie KW, Marcusson EG, Freier SM; WPI; 2004-774955/76. New antisense compound which inhibits the expression of hypoxia-inducible factor 1 alpha (HIF1 alpha) and/or HIF2 alpha, useful for treating hyperproliferative disorder, e.g. cancer carrying a p53 mutation. Claim 92; SEQ ID NO 446; 195pp; English.	The present invention relates to antisense compounds targeted to nucleic acids encoding hypoxia-inducible factor 1 alpha (HIFlalpha) and/or hypoxia-inducible factor 2 alpha (HIFlalpha). The antisense compound comprises an antisense oligonuclectide that specifically hybridises with the nucleic acid and inhibits the expression of HIFlalpha and/or HIFLalpha. The antisense oligonuclectide is a chimeric oligonuclectide. The antisense oligonuclectide comprises at least one modified internucleoside linkage, preferably a phosphorchhoate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOB) sugar moiety. The antisense oligonuclectide further comprises at least one modified nucleobase, preferably a 5-comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonuclectides are useful for the

preferably a cancer carrying a p53 mutation, or an angiogenic disorder preferably a cancer carrying a p53 mutation, or an angiogenic disorder that affects the eye. The compound is also useful for treating tumours, hyperplasias, pulmonary fibrosis, angiogenesis, psoriasis, atheroselerosis and smooth muscle cell proliferation in the blood vessels such as stenosis or restenosis following angioplasty. It is also useful in drug discovery and target validation, and can be utilised for disgnostics, therapeutics, prophylaxis and as research reagents and kits. The present sequence represents an oligonucleotide used in the examples of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound which inhibits the expression of hypoxia-inducible factor 1 alpha (HIF1 alpha) and/or HIF2 alpha, useful for treating hyperproliferative disorder, e.g. cancer carrying a p53 mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to antisense compounds targeted to nucleic acids encoding hypoxia-inducible factor 1 alpha (HIFlalpha) and/or hypoxia-inducible factor 2 alpha (HIFlalpha). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of HIFlalpha and/or HIFLalpha. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also

comprises at least one modified sugar moiety, preferably a 2'-0-
methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotide further
comprises at least one modified nucleobase, preferably a 5-
methylcytosine. The antisense oligonucleotides are useful for the
comprises such as hyperproliferative disorders, e.g. cancer,
creatment of diseases such as hyperproliferative disorders, e.g. cancer,
creatment of diseases und a special proliferation or an angiogenic disorder
creatment of diseases por mopound is also useful for treating tumours,
that affects the eye. The compound is also useful for treating tumours,
characterosis and smooth muscle cell proliferation in the blood vessels
such as stenosis or restenosis following angioplasty. It is also useful
cin drug discovery and target validation, and can be utilised for
diagnostics, therapeutics, prophylaxis and as research reagents and kits.
The present sequence represents an oligonucleotide used in the examples
                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠ
                                                                                                                                                                                                                       The present invention relates to antisense compounds targeted to nucleic acids encoding hypoxia-inducible factor 1 alpha (HIFLalpha) and/or hypoxia-inducible factor 2 alpha (HIFLalpha) and/or hypoxia-inducible factor 2 alpha (HIFLalpha) and/or comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of HIFLalpha and/or the antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified comprises at least one modified supar moiety, preferably a 2'-0-comprises at least one modified supar moiety, preferably a 5'-0-comprises at least one modified nucleobase, preferably a 5'-0-comprises at least one modified nucleobase, preferably a 5'-0-comprises at least one modified nucleobase, preferably a 5'-0-comprises at least one modified supar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5'-0-comprises and smooth muscle call proliferation in the blood vessels such as stenosis following angioplasty. It is also useful in drug discovery and target validation, and sure butilised for the mass at an angiogenic and butilised for the present sequence represents an antisense oligonucleotide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                             New antisense compound which inhibits the expression of hypoxia-inducible factor 1 alpha (HIF1 alpha) and/or HIF2 alpha, useful for treating nyperproliferative disorder, e.g. cancer carrying a p53 mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense oligonucleotide (ISIS 337224) for human HIFlalpha/HIF2alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense therapy; human; hypoxia-inducible factor 1 alpha; hypoxia-inducible factor 2 alpha; HFRalpha; HFRalpha; HRASAlpha; HRASAlpha; HRASAlpha; HRASAlpha; HRASAlpha; HRASAlpha; HRASALPHA; HRASALPHA; HASPOXIA; SANCAL, TANGORENIC GISOCHER; ENGORENIC PARTISES; ANGIOGENERY; ENGORIN MUSCLE CELL PERIFERATION; PARTISES, ANGIOGIASTY; CYCOSTATIC; ANGIOGENERS; OPHTHALMOLOGICAL; ANTINFILMMATORY; RESPIRATORY; VASORIOPIC; SS.

The present invention relates to antisense compounds targeted to nucleic acids encoding hypoxia-inducible factor 1 alpha (HIFIalpha) and/or hypoxia-inducible factor 2 alpha (HIFIalpha) the and/or hypoxia-inducible factor 2 alpha (HIFIalpha). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of HIFIalpha and/or HIFIalpha. The antisense oligonucleotide comprises at least one modified comprises at least one modified comprises at least one modified sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-0-0 methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-0-0 methylorycosine. The antisense oligonucleotides are useful for the creatment of diseases such as hyperpoliferative disorders, e.g. cancer, preferably a cancer carrying a p53 mutation, or an angiogenic disorder, hyperplasias, pulmonary fibrosis, and somethyloriasis, also useful for treating tumours, hyperplasias at stenosis or restenosis following angioplasty. It is also useful in drug discovery and target validation, and can be utilised for diagnostics, therapeutics, prophylaxis and as research reagents and kits. The present sequence represents an oligonucleotide used in the examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense compound which inhibits the expression of hypoxia-inducible factor 1 alpha (HIP1 alpha) and/or HIF2 alpha, useful for treating hyperproliferative disorder, e.g. cancer carrying a p53 mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

'n,

Human HIF-1 antisense oligonucleotide RX-0041.

```
the nucleic acid and inhibite the expression of Highalpha and/or the nucleic acid and inhibite the expression of Highalpha and/or Highalpha. The antisense oligonucleotide is a chimeric oligonucleotide comprises at least one modified comprises at least one modified sugar moiety, preferably a 2'-0- comprises at least one modified sugar moiety, preferably a 2'-0- comprises at least one modified sugar moiety, preferably a 2'-0- comprises at least one modified nucleobase, preferably a 2'-0- comprises at least one modified nucleobase, preferably a 2'-0- methylcytosine. The antisense oligonucleotides are useful for the comprises such as hyperproliferative disorders, e.g. cancer, preferably a cancer carrying a p53 mutation, or an angiogenic disorder, that affects the eye. The compound is also useful for treating tumours, hyperplasias, pulmonary fibrosis, angiogenesis, psoriasis, activated such as stenosis and smooth muscle cell proliferation in the blood vessels such as stenosis or restenosis following and can be utilised for in drug discovery and target validation, and can be utilised for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compound which inhibits the expression of hypoxia-inducible factor 1 alpha (HIF1 alpha) and/or HIF2 alpha, useful for treating hyperproliferative disorder, e.g. cancer carrying a p53 mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   diagnostics, therapeutics, prophylaxis and as research reagents and kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to antisense compounds targeted to nucleic acids encoding hypoxia-inducible factor 1 alpha (HIF1alpha) and/or hypoxia-inducible factor 2 alpha (HIF2alpha). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents an oligonucleotide used in the examples of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a compound, RX-0047 or RX-0149 targeted to a nucleic acid molecule encoding human hypoxia inducible factor (HIF-1), where the oligonucleotide compound inhibits the expression of human HIF-1. Also described are: a method of inhibiting the expression HIF-1 in human cells or tissues, and a method of inducing cytotoxicity in a cancer cell. Specifically claimed are RX-0047 and RX-0149 compounds having a fully defined sequence comprising 20 bp (BSD ID NO. 2, 5' respectively). The compounds are useful for inhibiting the expression of HIF-1 and inducing the cytotoxicity in several cancer cells. The antisense compounds are also useful for preventing or delaying infection, antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                     New RX-0047 and RX-0149 antisense oligonucleotide compounds targeted to a nucleic acid molecule encoding human hypoxia inducible factor (HIF-1), useful for inhibiting expression of HIF-1 and inducing cytotoxicity in several cancer cells.

The present invention relates to antisense compounds targeted to nucleic acids encoding hypoxia-inducible factor 1 alpha (HIFIalpha) and/or hypoxia-inducible factor 1 alpha (HIFIalpha) and/or comprises an antisense oligomucleotide that specifically hybridises with the nucleic acid and inhibits the expression of HIFIalpha and/or HIFIalpha and/or The antisense oligomucleotide is a chimeric oligomucleotide. The antisense oligomucleotide is a chimeric oligomucleotide. The antisense oligomucleotide sugar motery, preferably a 2'-O-methoxyethyl (2'-MOE) sugar motery. The antisense oligomucleotide further comprises at least one modified sugar motery. The antisense oligomucleotide further comprises at least one modified sugar motery. The antisense oligomucleotide further comprises at least one modified sugar motery. The antisense oligomucleotides are useful for the reatment of diseases such as hyperproliferative disorders, e.g. cancer, preferably a cancer arrying a p3 mutation, or an anglogenic disorder. The compound is also useful for treating tumours, the set of the se
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compound which inhibits the expression of hypoxia-inducible factor 1 alpha (HIF1 alpha) and/or HIF2 alpha, useful for treating hyperproliferative disorder, e.g. cancer carrying a p53 mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      hyperplassis, pulmonary fibrosis, angiogenesis, psoriasis, atherosciedrosis and smooth musche cell proliferation in the blood vessels such as stenosis or restenosis following angioplasty. It is also useful in drug discovery and target validation, and can be utilised for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        diagnostics, therapeutics, prophylaxis and as research reagents and kits The present sequence represents an oligonucleotide used in the examples

The present invention relates to antisense compounds targeted to nucleic acids encoding hypoxia-inducible factor 1 alpha (HIFJalpha) and/or hypoxia-inducible factor 2 alpha (HIFJalpha). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with England and inhibits the expression of HIFJalpha and/or HFZalpha. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified comprises at least one modified sugar moiety. The antisense oligonucleotide comprises at least one modified sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-0-0 methoxyethyl (2'-WDE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-0-0 methoxyethyl (2'-WDE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-0-0 methoxyethyl (2'-WDE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-0-0 methoxyethyl (2'-WDE) sugar moiety. The antisense oligonucleotide are useful for the carefunction as hyperpoliferative disorders, e.g. cancer, preferably a cancer carrying a p53 mutation, or an angiogenic disorder, hyperplasias pulmonary fibrosis, angiogenesis, properiasis, whyperplasias and smooth muscle cell proliferation in the blood vessels canches at stenosis and target validation, and can be utilised for the the present sequence represents an oligonucleotide used in the examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound which inhibits the expression of hypoxia-inducible factor I alpha (HIF1 alpha) and/or HIF2 alpha, useful for treating hyperproliferative disorder, e.g. cancer carrying a p53 mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present invention relates to antisense compounds targeted to nucleic acids encoding hypoxia-inducible factor 1 alpha (HIFlalpha) and/or whooxia-inducible factor 2 alpha (HIFlalpha) and/or comprises an antisense oligomucleotide that specifically hybridises with the nucleic acid and inhibits the expression of HIFlalpha and/or: HIFLalpha. The antisense oligomucleotide is a chimeric oligomucleotide. HIFLalpha and/or: The antisense oligomucleotide comprises at least one modified comprises at least one modified sugar moiety, preferably a 2'-0-comprises at least one modified sugar moiety, preferably a 5-comprises at least one modified sugar moiety, preferably a 5-comprises at least one modified nucleobase, preferably a 5-comprises and least so antisense oligomucleotides are useful for the reather of diseases such as hyperproliferation, or an angiogenic disorder that affects the eye. The compound is also useful for treating tumours, preferably a cancer carrying a p53 mutation, or an angiogenic disorder that affects the eye. The compound is also useful for treating tumours, and preparate and smooth muscle call proliferation in the blood vessels such as stenosis or restenosis following angiopalasty. It is also useful and and target and any argument and any argument of all proliferation in the horavely and and target walldation, and can be utilised for the analyse of the proportion and any argument of any and argument of any argument of any and any argument of any and any argument of any argument of any and argument of any argument of any argument and a propagal and any argument and argument and argument and ar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     diagnostics, therapeutics, prophylaxis and as research reagents and kits. The present sequence represents an oligonucleotide used in the examples

The present invention relates to antisense compounds targeted to nucleic acids encoding hypoxia-inducible factor 1 alpha (HFIalpha) and/or whoxia-inducible factor 2 alpha (HFIalpha). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of HFIalpha and/or the nucleic acid and inhibits the expression of HFIalpha and/or THE antisense oligonucleotide comprises at least one modified.

THE alpha. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-cc methoyschyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5'-0-cc methylcytosine. The antisense oligonucleotides are useful for the treatment of diseases such as hyperproliferative disorders, e.g. cancer. Comprises and pass mutation, or an angiogenic disorder chat affects the eye. The compound is also useful for treating tumours, hyperplasias, pulmonary fibrosis, angiogenesis, psoriasis, and anoth muscle call proliferation in the blood vessels and smooth muscle call proliferation in the also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound which inhibits the expression of hypoxia-inducible factor I alpha (HIFI alpha) and/or HIF2 alpha, useful for treating hyperproliferative disorder, e.g. cancer carrying a p53 mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        diagnostics, therapeutics, prophylaxis and as research reagents and kits. The present sequence represents an oligonucleotide used in the examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           such as stenosis or restenosis following angioplasty. It is also useful in drug discovery and target validation, and can be utilised for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        classifying patients suffering from an inflammatory disease. The method comprises identifying in DNA from at least 1 patient a sequence comprises identifying in DNA from at least 1 patient a sequence (AAT88431), in a 5-LOX regulatory gene sequence. The method can be applied to subjects with asthma, ulcerative colitis, bronchitis, annuatis, psoriamis, allergic and non-allergic rhinitis, lupus or rheumatoid arthritis. Specifically it can be used to diagnose asthma or susceptibility to disease, identify treatments suitable for individual patients or assess the likely success of treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence was used in the development of a novel method for

The present invention describes a sense strand or a unuscriberation that that comprises a nucleotide sequence that is complementary to HIFI RNA or a portion thereof, and where a second strand is the complementary antisense sink strand. Note that the sense region is connected to the antisense region via a polynucleotide linker molecule. Accordingly, these sinks are useful in providing compositions for the treatment of traits, diseases and conditions that respond to modulation of HIFI expression, namely cancer and proliferative conditions including macular degeneration, diabetic retinopathy and other conditions associated with hypoxia inducible proliferation. As such, these compositions exhibit cytostatic, ophthalmological and antidiabetic activities. This oligonucleotide sequence is an antisense siRNA strand that targets human HIFI RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New chemically synthesized double stranded short interfering nucleic acid molecule that directs cleavage of a hypoxia inducible factor 1 RNA via RNA interference (RNAi), useful for modulating HIF1, its expression or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel chemically synthesized double stranded short interfering nucleic acid strand (sinA). Specifically, it refers to sinAs that direct cleavage of a hypoxia inducible factor I (HTI) RNA via RNA interference (RNA). In particular, the sinAs may include short interfering RNA (siRNA), double-stranded RNA (daRNA), micro-RNA (miRNA) and short hairpin RNA (shRNA) molecules that are capable of mediating RNA; The present invention describes a sense strand of a double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```
This invention relates to a novel chemically synthesized double stranded short interfering nucleic acid strand (siNA). Specifically, it refers to short interfering nucleic acid strand (siNA). Specifically, it refers to siNAs interference (RNAi). In particular, the siNAs may include short interfering RNA (siRNA), double-stranded RNA (dsRNA), micro-RNA (miRNA) and short hairpin RNA (shRNA) molecules that are capable of mediating RNAi. The present invention describes a sense strand of a double-stranded siNA, that comprises a nucleotide sequence that is complementary cantisense single strand. Note that the sense strand is the complementary antisense region via a polynucleotide linker molecule. Accordingly, these siNAs are useful in providing compositions for the treatment of traits, classases and conditions that respond to modulation of HIFI expression, chamely cancer and proliferative conditions including macular degeneration, diabetic retinopathy and other conditions associated with the cytostatic, ophthalmological and antidiabetic activities. This coligonucleotide sequence is a sense composition exhibit to cytostatic, ophthalmological and antidiabetic activities. This coligonucleotide sequence is a sense siRNA strand that targets human HIFI CYC RNA to modulate expression given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New chemically synthesized double stranded short interfering nucleic acid molecule that directs cleavage of a hypoxia inducible factor 1 RNA via RNA interference (RNAi), useful for modulating HIF1, its expression or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  88; short interfering RNA; siRNA; gene silencing; RNA interference;

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic caids of the invention are useful as probes and primers for detecting, identifying, quantifying and or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, propypeptides, vectors containing the nucleic acids, cells containing the coctor or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein collips. The nucleic acid sequences of the invention can be used in gene collips. The nucleic acid sequences of the invention can be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The present invention relates to a test for detecting autism, which comprises measuring the electrical activity of calcium-dependent comprises measuring the electrical activity of calcium-dependent of potassium channels (BKCa) in a sample of blood cells and detecting any reduction in activity, relative to a control sample. Also claimed are: selecting aubpopulation of patients with autism by performing the new method and selecting subjects with reduced BKCa activity; and use of activators or agonists of BKCa to prepare a composition for treating autism where this is associated with deficient electrical activity. The method is useful for autism diagnosis and prognosis and to identify a subset of autism patients who may benefit from the invention, a capsists (X) of BKCa, i.e. patients where autism is linked to a defective electrical activity. In an example from the invention, a cansistent with autism was detected and characterized using PCR primers ADM14128. The KCMMA1 gene encodes a protein of the glucaminersic complex, and mutation of the KCMMA1 gene resulting in inadequate functioning of BKCa. The translocation was [46, XY, t[9;10) [423;422]], and the break was between the first and second exons of the KCMMA1 gene and amplification tests showed that, in the patient, one copy of the

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used as probes to detect, characterise and quantify nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specific blomolecule and/or amount specifically of hGDMLP proteins, as specific blomolecule and/or amount specifically of hGDMLP proteins, as specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed or present in the exemplification of the printed or print or the exemplification of the printed or present in the exemplification of the printed or present in the exemplification of the printed or present sequence in the exemplification of the present invention. N.B. The feature data for this patent did not form part of the printed or print proteins and produced in electronic format directly from MIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                        Human, genome-derived myosin-like protein 1, GDMLP-1, hGDMLP-1, heart, muscle, myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WWV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNASyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, tleast ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nuclectides and a 3' end andification of a 3'-3' inverted abasic molety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid

```
The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 958 deviation from (S1) which are conservative substitutions, and 65% identity to (S1). A polypeptide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63103
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Askin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for invention (see AAF45151 and AAF45153 inchthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ineoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ameliorating the effects of a disorder, e.g. psoriasis, by administering JV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for ameliorating the effects

The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP] — 2 or IGFBPB), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense AAP45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pitytiasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasiss, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense therapy, antiproliferative; antinflammatory; antipsoriatic, cytostatic, dermatological; cardiant; virucide, ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityliasis; IGF binding procein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilatis; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neophasia; scleroderma; wart; skin cancer; sclerotic disease; hypermeovascular condition; hyperplasis, kidney disease; neobascular condition of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disease, hyperproliferation of the inside of blood

```
The invention relates to a novel method for testing secondary hyperparathyroidism in a chronic renal failure patient. The method involves detecting a variation in a gene chosen from CACNAIC, CALCRI, CHI31L, EGF, FGFI, GFRAI, GFRSE, GFRK, ILIORA, ILLORB, ILLIZRBI, KCWJI, ORCTIA, PDGFRA, SCYBIA, SLC2A1, SLC2A3, TGFBR3, TWEMI, CALCR, LILTR, OSTFI, FGFE, HGF, MET, TGFBI and VGGF, or detecting the base in a polymorphism region existing in the vicinity of any one of the genes. The invention further comprises a reagent or kit for testing secondary hyperparathyroidism in a chronic renal failure patient. This polymorlectide sequence represents a probe used in the detection of a polymorphism in a gene linked to secondary hyperparathyroidism of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Testing secondary hyperparathyroidism in chronic renal failure patient, involves detecting variation in gene chosen from CACNA1C, CALCRL, CH13L1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hyperparathyroidism polymorphic detection VIC probe, SEQ ID 200.
                                                                                                                              Hyperparathyroidism polymorphic detection VIC probe, SEQ ID 33.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         secondary hyperparathyroidism; endocrine-gen.; antithyroid;

                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel method for testing secondary hyperparathyroidism in a chronic renal failure patient. The method involves detecting a variation in a gene chosen from CACNAIC, CALCRL, CHISIL, ESF, FGFI, GFRAI, GRREG, ILIORA, ILIORA, ILIORB, ILIZRBI, KCNJI4, KCNQI, ORCIL4, PDGFRA, SCYBI4, SLC12A1, SLC2A3, TGFBR3, TMEM1, CALCR, ILI7R, OSTFI, FGFG, HGF, MET, TGFBI and VEGF, or detecting the base in a polymorphism region existing in the vicinity of any one of the genes. The invention further comprises a reagent or kit for testing secondary hyperparathyroidism in a chronic renal failure patient. This polymorphism in a geneents a probe used in the detection of a polymorphism in a gene linked to secondary hyperparathyroidism of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; 88; EGFR; epidermal growth factor receptor; HER1; HER2; HER3; HER4; hammerhead ribozyme; inozyme; zinzyme; DNAzyme; amberzyme; cancer; brain tumour; cytostatic; short interfering RNA; siRNA, RNA interference; prostate cancer; colorectal cancer; brain cancer; oesophageal cancer; stomach cancer; pladder cancer; panoreatic cancer; cesophageal cancer; head and neck cancer; ovarian cancer; melanoma; lymphoma; glioma;
                                                                                                                                                                                                                                                        Testing secondary hyperparathyroidism in chronic renal failure patient, involves detecting variation in gene chosen from CACNAIC, CALCRL, CHI3L1, EGF, FGFI, GFRAI, GPR56 and GPRK6.

                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a double stranded short interfering RNA (siRNA) molecule that inhibits expression of epidermal growth factor receptor (EGFR) gene (e.g. HERL-4) by RNA interference is new Also included is an expression vector comprising a nucleic acid sequence encoding siRNA molecule (s) in a manner that allows expression of the nucleic acid molecule. The siRNA molecules comprise harmershead ribozymes, inozymes, amberzymes and DNAzymes. The invention is used for inhibiting expression of EGFR. It can be used for treatment of cancer, prostate cancer, colorectal cancer, para cancer, ossophageal cancer, stomach cancer, bladder cancer, para nancer, cervical cancer, head and neck cancer, ovarian cancer, molanoma, julioma, multidrug resistant cancer, ovarian cancer, molanoma, palioma, multidrug resistant cancer in vitro, stability, and ease of introduction of oligonucleotide to target site. The present sequence is an EGFR/HERI-4 target sequence for

least the variation/mutation part of a plant gene using a gene comparing the comparing a part of a plant gene using a gene comparing a genetic polymorphism marker. A mutation site of the plant gene is mapped by utilizing a genetic polymorphism marker as follows: (a) genomic DNA is prepared from a plant homozygously having a mutation to be an object of the mapping; (b) A forward primer 1 containing a base corresponding to the gene polymorphic maker of one ecotype plant, a forward primer 2 containing a base corresponding to the genetic polymorphism of the other ecotype plant and a reverse primer 3 based on the base sequence common oligonucleotides emitting a luorescence of different colors when the colors plants marker is detected are prepared; (d) an amplification reaction of the genomic DNA is carried out in the presence of the primers 1, 2 and 3 and the two kinds of the oligonucleotides; (e) the fluorescence intensity emitted from the resultant reactional product is detected and (f) the position on the genome of the mutation site is determined from the results of detection. The present sequence is a primer, used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
A primer set and method useful for mapping at least the variation/mutation part of a plant gene using a gene polymorphism marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying an individual who has altered risk for developing myocardial infarction comprises detecting single nucleotide polymorphism (SNP), in the individual's nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to identifying an individual who has altered risk for developing myocardial infarction comprises detecting single
                                                                                                                                                                                                                       The present invention relates to a primer set and method for mapping at

```
cc nucleotide polymorphism (SNP) in any one of the 43336 nucleotide
c sequences (not given in the specification), in the individual's nucleic
c acids, where the presence of the SNP is correlated with an altered risk
c for myocardial infarction in the individual. Also included are an
c isolated nucleic acid molecule (comprising at least 8 contiguous
c nucleotides where one of the nucleotides is an SNP as cited above, or
their complement), an isolated polypeptide comprising an amino acid
c sequence selected from any of the 696 amino acid sequences not defined in
c the specification, an antibody that specifically binds to the polypeptide
CC (or its antigen-binding fragment), an amplified polymucleotide containing
the SNP as cited (where the amplified polymucleotide is between about 16
c (or its antigen-binding fragment), an isolated polymucleotide which
cc (its antigen-binding fragment), an isolated polymucleotide which
cc the specifically hybridises to a nucleic acid molecule containing the SNP, a
ckit for detecting SNP in a nucleic acid, detecting in a nucleic acid, detecting in therapeutically or prophylactically treating myccardial infarction.

CT the detection step of the method is carried out by a process selected
cin allele-specific amplification, sequencing, squencing, squencing, and single-stranded conformation, sequencing ST unclease
cd digestion, molecular beacon assay, oligonucleotide ligation assay, size
analysis, and single-stranded conformation polymorphism. The method is
cyocardial infarction. The present sequence is common primer (used with
c myocardial infarction an applicated marker gene. NOTE: SEQ IDS I.
c from a myocardial infarction associated marker gene.

CT hese sequence are contained on a CD-R named CL001509CDR which has not
cc been supplied with the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

The invention relates to single nucleotide polymorphisms in the gene encoding the human natriuretic peptide receptor A/guanylate cyclase A (atrionatriuretic peptide receptor A) or NPRI polypeptide. A method for haplotyping the NPRI gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the NPRI haplotypes given in the specification or whether both copies are defined by a haplotype pair of the NPRI gene can be assigned to specific genotyping, whereby all possible haplotype pairs and a haplotype or haplotype pair of the NPRI gene can be identified by comparing the frequency of the haplotype pair in a reference population, where a higher haplotype or haplotype pair. NPRI and its corresponding DNA are used for studying the expression and function of NPRI, for use in screening for candidate drugs to treat diseases related to NPRI activity, such as hypertension. The sequences are also useful for studying the effect of variation on the biological activity of candidate drugs targeting NPRI. Sequences AAS99999-AAS99990 and ABK09390-ABK09462 represent probes, sequencing primers and PCR

The invention relates to isolated polypeptides of the severe acute respiratory syndrome (SARS) coronavirus. The polypeptides include spike (S or ES), and (E or EM), membrane (W or E1), hemagajutninh-esterase (HE or E3), and mucleocapsid (N) polypeptides, and hemographic or E3), and mucleocapsid (N) polypeptides, and hemographic or E3), and mucleocapsid (N) polypeptides, and hemographic also relates to antibodies which recognise the polypeptides; mucleic acids encoding the SARS virus polypeptides; primers specific for SARS virus public to acids encoding the SARS virus for amplifying SARS virus target nucleic acids, and acids encoding the SARS virus for amplifying SARS virus spike protein; a viral vector for in vivo delivery of a SARS virus polypeptide-concident in the invention additionally provides a vaccine for the proparation. The invention additionally provides a vaccine for the restment or prevention of SARS compalising an inactivated SARS virus, an attenuated SARS virus, an inactivated SARS virus polypeptides. Confiled SARS virus antigens and a mammalian cell in alpha-virus preparation, or at least one purified SARS virus antigens; methods of making inactivated SARS virus antigens. The invention further encompasses a method of replicon particle comprising one or more SARS virus antigens; and a satisfication or more SARS virus antigens and cone or more SARS virus polypeptides and containing antigens. The invention further encompasses a method of identifying a therapeutically active agent by measuring the effect of the restment or prevention of SARS. The SARS virus polypeptides and containing them are useful for diagnosing or identifying the presence of SARS virus specific primers and SARS virus polypeptides and antibodies against them, and SARS virus specific primers and SARS virus polypeptides and antibodies against them, and SARS virus specific primers and sars corneaning them are useful for diagnosing or identifying the presence of the amplifying a SARS cornearing from part of the presence of the second 
                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to isolated polypeptides of the severe acute respiratory syndrome (SARS) coronavirus. The polypeptides include spike (S or E2), env (E or sM), membrane (M or E1), hemagglutinin-seterase (HE or E3), and nucleocapsid (N polypeptides, and the ORF1a and ORF1ab and ORF1ab.

(replicase) polypeptides and their proteolytic fragments. The invention also relates to antibodies which recognise the polypeptides; nucleic acids to antibodies which recognise the polypeptides; nucleic acids and ordered RNA molecule 10.30 nucleotides in length which is able to inactivate the SARS virus spike which is able to inactivate the SARS virus in a mammalian cell; an expression construct for recombinant expression of a SARS virus spike ordering antigen. The invention additionally provides a vaccine for the concing nucleic acid; and a mammalian cell line stably expressing a SARS virus, an attenuated SARS virus, a split SARS virus, a preparation, or at least one purified SARS virus antigens; methods of reparation, or at least one purified SARS virus antigens; and a making inactivated SARS virus and analyal and provides a vaccine for the creatment or prevention of SARS virus, a split SARS virus and palabavirus cepticon particle comprising one or more SARS virus and analyal and palabavirus and vaccines containing it; an alpha-virus replicon particle comprising one or more SARS virus and one or more

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                ö
respiratory virus antigens. The invention further encompasses a method of identifying a therapeutically active agent by measuring the effect of the agent on a SARS-related enzyme, and a method of treating a SARS patient using small molecule viral inhibitors. The SARS virus polypeptides and nucleic acids can be used in the preparation and manufacture of vaccines for the treatment or prevention of SARS. The SARS virus polypeptides, antibodies against them, and SARS virus-specific primers and kits containing them are useful for diagnosting or identifying the presence of SARS in a biological sample. The present sequence represents a PCR primer for amplifying a SARS coronavirus gene. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Han J;

The invention relates to isolated polypeptides of the severe acute respiratory syndrome (SARS) coronavirus. The polypeptides include spike (Sor E2), and respiratory syndrome (SARS) coronavirus. The polypeptides include spike (Sor E3), and nucleocapsid (N) polypeptides, and the ORF1a and ORF1a and ORF1a and orelates to antibodies which recognise the polypeptides; mucleic acids encucioning the SARS virus polypeptides; primers specific for SARS virus nucleic acids sequences; kits for amplifying SARS virus target uncleic acids adouble-stranded RNA molecule 10-30 nucleotides in length which is able to inactivate the SARS virus in a mammalian cell; an expression construct for recombinant expression of a SARS virus spike protein; a viral vector for in vivo delivery of a SARS virus spike protein; a viral vector for in vivo delivery of a SARS virus spike protein; a viral vector for in vivo delivery of a SARS virus spike protein; a viral vector for in vivo delivery of a SARS virus spike protein; a viral vector for in vivo delivery of a SARS virus spike protein; a viral vector for in vivo delivery of a SARS virus spike. The invention additionally provides a vaccine for the treatment or prevention of SARS comprising an inactivated SARS virus and sequence of making inactivated SARS virus and vaccines containing it; an alpha-virus replicon particle comprising one or more SARS virus antigens; and a method of treating a SARS virus antigens. The invention further encompasses a method of identifying a therapeutically active agent by measuring the effect of the sagning them are useful for diagnosing or identifying the presence of sagning them are useful for diagnosing or identifying the presence of sagning them are useful for diagnosing or identifying the presence of sagning them are useful for diagnosing or identifying the presence of sagning them are useful for diagnosing or identification, but was obtained in all prevents of the prisect respiratory formar directly from WIPO at the present sequence effect of the private of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                            New microarray for measuring gene expression characteristics of hemetopoietic cells, useful for preparing a composition for diagnosing or treating myeloid leukemia.
                                                                                                                                                                                                                         The invention describes a microarray for measuring gene expression characteristics of haematopoietic cells comprising at least 5 polynucleotides having distinct sequences. Also described are: a method of diagnosing or treating an abnormality associated with haematopoiesis, and diagnosing or treating in a patient. The microarray is useful for preparing a composition for diagnosing or treating myeloid leukaemia. This sequence represents an expressed sequence tag (EST) isolated from a cell of a patient with acute myeloid leukaemia with the t(9;11) translocation that results in the mixed-lineage leukaemia (MML)-AF9
                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tag sequence, colorectal cancer, pancreatic cancer, colon cancer, diagnosis, prognosis, treatment, ss.

                                                                                                                                                                                                                                           AAX30947-31815 represent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen date base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnoshing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comparises comparing the level of at least one transcript in a first sample of a tissue to a being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the diagnosis, prognosis and

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an entisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AAP45151 and AAP45153 - P4561). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a neoplasias, such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hipperpooliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      vessels or any other hyperplasia

inhibiting or reducing growth factor mediated cell proliferation, infilammation and/or other disorders. The present sequence is an infilammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF45151 and AAF45153 - F55161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pitaris, serborrhoea, Keloids, Keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK32770 represent human colon and pancreatic cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of detecting a single nucleotide polymorphism (SNP) in an organism by amplifying a nucleic acid sequence of an organism using a hairpin shaped primer that discriminates between different alieles by situating its 3' nucleotide at the location of a SNP, and measuring threshold cycle or amplification efficiency or amount of amplified product. A lower amplification efficiency or delayed threshold cycle or amplification efficiency or delayed threshold cycle or a fiference in the amount of amplified product is indicative of a mismatch between the primer and the organism and a SNP in the organism. The method is useful for efficiently identifying SNPs responsible for drug resistence of infective organism. The method and means for comprehensive understanding of the frequency and position of mutations in an organism. This sequence corresponds to an extended hairpin tail primer used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                             Detecting single nuclectide polymorphism (SNP) in an organism, useful for identifying SNPs responsible for drug resistance, comprises amplifying a nucleic acid sequence of an organism using a hairpin shaped primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to a method of detecting a single nucleotide polymorphism (SNP) in an organism by amplifying a nucleic acid sequence of an organism using a hairpin shaped primer that discriminates between different alleles by situating its 3' nucleotide at the location of a SNP, and measuring threshold cycle or amplification efficiency or amount of amplified product. A lower amplification efficiency or delayed threshold cycle or a fiference in the amount of amplified product is indicative of a mismatch between the primer and the organism and a SNP in the organism. The method is useful for efficiently identifying SNPs responsible for drug resistance of infective organisms. The method and with are useful for analysing large number of isolates, thus providing a means for comprehensive understanding of the frequency and position of mutations in an organism. This sequence corresponds to an extended hairpin tail primer used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting single nucleotide polymorphism (SNP) in an organism, useful for identifying SNPs responsible for drug resistance, comprises amplifying a nucleic acid sequence of an organism using a hairpin shaped primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   mutation; DNA detection; glucose-6-phosphate dehydrogenase; probe; ss.

                                                                                                                                                                                                                                              The invention relates to a method for identifying nucleic acid mutations. The method comprises: (a) obtaining a sample of target nucleic acid oligomers comprishing at least one target sequence; (b) loading the parts onto at least two portions of binding medium; (c) detecting the parts peaks in the fluid exiting from each of the portions of binding medium; and (d) analyzing the oligomer peak data from the portions of binding medium. Also described is an apparatus for identifying nucleic acid mutations. The method is useful in identifying nucleic acid mutations. The sequence represents a wild type probe for human glucose-6-phosphate dehydrogenase (G6PD), which is used in the exemplification of
                                                                                                                                                                      Identifying nucleic acid mutations by obtaining a sample of target nucleic acid oligomers comprising a target sequence and detecting oligomer peaks in the fluid exiting from each of the portions of binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense; phosphorylation; retinoblastoma; tumour suppressor; ribozyme; antagonist; kinase; cyclin; cdk4; Rb; ss.

The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-ABC0010-A
single nucleotide polymorphic site (SNP: AAH88797-AAH89219). The present sequence is one such oligonucleotide. The oligonucleotides can be used in forensice, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BNP, single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 targeseent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99889, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at the printed specification, but tho witho int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence of probe which corresponds to the AA sequence W-N-Y-L-D (515-519) of human tissue plasminogen activator (TPA).
                                                                                                                                                                                                                     Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine
                                                                                                                                                                                                                                                                                                              claim 1; SEQ ID NO 228161; 29pp + Sequence Listing; German.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

New nucleic acid that modulates expression of the vanilloid receptor-1, useful for control of pain or sensitivity disorders, comprises sequences from control regions of the receptor gene.

Disclosure, Page 48; 68pp; German.

This invention describes a novel nucleic acid containing a specific segment having at least one region that modulates expression of the VRI (vanilloid receptor type 1) receptor, or a functional derivative, allele or fragment of this region, or a segmence that hybridises to it under the positions 21931-22334 of GenBank AL670399, 31673-3635 of AL663116, or 4731-43211 or 36616-33151 of AR67319, 31673-3635 of AL663116, or pain, particularly in primary sensory neurons. The invention also pain, particularly in primary sensory neurons. The invention also this vector (other than human germ or embryonal stem cells) and a method for modulating expression of the VRI receptor by introducing the modulating expression of the VRI receptor by introducing the modulator or the vector into a cell that contains the VRI gene. The products of the invention are used for detecting a transcription factor from its binding to a regulatory sequence (or a double-erranded cliem of it), e.g. by Western blotting or enzyme-

       associated with overexpression or underexpression of the transcription factor. The region that modulates VR1 receptor expression includes a binding site for a transcription factor, e.g. MZF1, NFRappaB, NFAT or GATA1. The nucleic acids of the invention, or vectors containing them, are used for prevention or treatment of pain, also for treating sensitivity disorders, e.g. analgesia, hypalgesia or hyperalgesia, also neuralgia and myalgia, that are associated with activity of the VR1 receptor. This sequence represents a fragment of rat VR1 exon 1d DNA which is capable of binding to a transcription factor.
                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; peroxisome proliferator activated receptor gamma; PPAR-gamma, regulatory sequence; promoter; obesity; anorexia; lipoma; cachexia; lipodystrophy; liposarcoma; human immunodeficiency virus; HIV; insulin resistance; non-insulin-dependent diabetes mellitus; polycystic ovary syndrome; gastrointestinal tract; Crohn's disease; inflammatory bowel disease; ulcerative colitis; bowel cancer; ss.

The present invention describes an isolated, purified or enriched nucleic acid comprising a control region of a human peroxisome proliferator activated receptor gamma (PPAR-gamma) gene. The nucleic acids are useful for screening for agents capable of modulating the expression of a human PPAR-gamma gene. These agents (modulators) form pharmaceutical compositions that are useful for treating diseases associated with high/low levels of human PPAR-gamma gene expression. The diseases include obesity, anorexia, cachexia, lipodystrophy, lipomas, lipodaccomas, abnormalities associated with anti-human immunodeficiency virus (HIV) treatment, insulin resistance, non-insulin-dependent diabetes mellitus

```
ö
(NIDDM), polycystic ovary syndrome, diseases of the gastrointestinal (GI) tract, inflammatory bowel disease, Crohn's disease, ulcerative colitis and bowel cancer. The nucleic acids are useful for studying the role of the PPAR-gamma gene in various diseases and disorders. The structure of PPAR-gamma enables genetic studies of PPAR-gamma mutations in humans, and evaluation of its role in disorders like insulin resistance, NIDDM, and diseases associated with altered adipose tissue function, like obesity and lipodystrophic syndromes. The nucleic acids are also useful for gene therapy and the production of transgenic animals, which are useful in screening for modulators of the human PPAR-gamma gene, which are useful in designing drugs for treating disorders or diseases associated with the level of PPAR-gamma ene expression. The present sequence represents the human PPAR-gamma -1-E-box
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Analyzing haplotype, by detecting polymorphism in drug-related genes, electing common polymorphism (CP), building haplotype block using CP, specifying CP within block, specifying tag polymorphism from CP within

```

The invention relates to a method of analyzing haplotype, by detecting gene polymorphism in drug-related genes such as arryl accetylamide deacetylase, arylalkylamine N-acetyl transferase or APP-binding cassette, sub-family A (ABC1), member 1. The method is useful for analyzing

haplotype. The method is useful for estimating the sensitivity or disease of a medicine or a foreign material, for selecting medicine for preventing or treating diseases, for determining appropriate dosage of medicine for preventing or treating disease, for analyzing a drug interaction, and for determining the related polymorphism relative to the sensitivity of the medicine, foreign material or disease. The diseases include malignant tumor, immune disorder circulatory disease, metabolic disease, kidney disease, respiratory disease and muscle associated disease. The method enables analysis of the individual differences related to the sensitivity of a medicine, using a haplotype, without using each single nucleotide polymorphism. The present sequence represents a human SNP detection related oligonucelotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polyamīde chain"

                  The invention relates to a polyamide molecule which specifically binds to a predetermined site in the minor groove of a double-stranded DNA molecule in a sequence-specific manner and which contains an alpha-amino acid domain (termed the "positive patch") which contacts nuclectides in the major groove and thus inhibits the activity of major groove DNA-binding proteins. The polyamide molecule comprises one or more amino acids containing a N-methylpyrrole, 3-hydra-methylpyrrole and/or N-methylimidazole group, where one or more of these amino acids, and a positive patch consisting of a 2 amino acid rigid group adjacent to a positive patch consisting of a 2 amino acid rigid group adjacent to a positively charged group (such as a positively charged amino acid). The polyamides of the invention inhibit gene appread of inhibiting gene expression by contacting a regulatory sequence of a gene with a polyamide of the invention also relates to a method of inhibiting gene expression. Sequences AED86939-binding proteins, thus inhibiting gene expression. Sequences AED86939-binding proteins, thus inhibiting gene expression. Sequences AED86939-binding proteins, thus inhibiting gene expression. Sequences AED86939-binding by a polyamide of the invention. This capable of being bound by a polyamide of the invention. This clivention to determine the optimum positive patch peptide sequence for invention to determine the optimum positive patch peptide sequence for
                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /bound_moiety= "Imidazole- and pyrrole-containing

The invention relates to a polyamide molecule which specifically binds to a predetermined site in the minor groove of a double-stranded DNA molecule in a sequence-specific manner and which contains an alpha-amino acid domain (termed the "positive patch") which contacts nuclectides in the major groove and thus inhibits the activity of major groove DNA-binding proteins. The polyamide molecule comprises one or more amino acids containing a N-methylpyrrole, 3-hydroxy-N-methylpyrrole and/or N-methylimidazole group, where one or more of these amino acid(s) are not alpha-amino acids, and a positive patch consisting of a 2 amino acid crigid group adjacent to a positively charged group (such as a positively charged amino acid). The polyamides of the invention inhibit gene expression by displacing or preventing the function of DNA-binding proteins such as transcription factors. The invention also relates to a captude of inhibiting gene expression by contacting a regulatory sequence invention is useful for inhibiting the binding and activity of DNA-binding proteins, thus inhibiting gene expression. Sequences AED86939-conding proteins, thus inhibiting the binding and activity of DNA-binding proteins, thus inhibiting the binding and activity of DNA-binding proteins, thus inhibiting the binding and activity of DNA-binding proteins, thus inhibiting the binding and activity of DNA-binding acides and used in DNA-binding and activity of DNA-conding and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polyamides comprising amino acids having N-methylpyrrole, 3-hydroxy-N-methylpyrrole and/or N-methylimidazole groups and positive patches having rigid groups adjacent to positively charged groups, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; 88; EGFR; epidermal growth factor receptor; HER1; HER2; HER3; HER4; hammerhead ribozyme; inozyme; zinzyme; DNAzyme; amberzyme; cancer;

The invention relates to a double stranded short interfering RNA (siRNA)

molecule that inhibits expression of epidermal growth factor receptor

EGGRN gene (e.g. HER1-4) by RNA interference is new. Also included is an

expression vector comprising a nucleic acid sequence encoding siRNA

molecule(s) in a manner that allows expression of the nucleic acid

molecule. The siRNA molecules comprise hammerhead ribozymes, inozymes,

amberzymes zinzymes and DNAzymes. The invention is used for inhibiting

expression of EGFR. It can be used for treatment of cancer, stomach

cancer, colorectal cancer, brain cancer, oesophageal cancer, stomach

cancer, ovarian cancer, melanoma, lymphoma, glioma, multidrug resistant

cancer or a brain tumour. The invention has enhanced shelf-life, half-

life in vitro, stability, and ease of introduction of oligonucleotide to

target site. The present sequence is an EGFR/HER1-4 target sequence for

an siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ...

```
The invention relates to a double stranded short interfering RNA (siRNA)

molecule that inhibits expression of epidermal growth factor receptor

CEGER) gene (e.g. HERL-4) by RNA interference is new. Also included is an

expression vector comprising a nucleic acid sequence encoding siRNA

molecule(s) in a manner that allows expression of the nucleic acid

molecule. The siRNA molecules comprise hammerhead ribozymes, inozymes,

concer. The siRNA molecules comprise hammerhead ribozymes, inozymes,

concer. The siRNA molecules comprise hammerhead ribozymes,

concer. Diadder cancer, brain cancer, oesophageal cancer, stomach

cancer, bladder cancer, melanoma, lymphoma, glioma, multidrug resistant

cancer or a brain tumour. The invention has enhanced shelf-life, half-

life in vitro, stability, and ease of introduction of oligonucleotide to

target site. The present sequence is an EGFR/HERI-4 target sequence for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                New double stranded short interfering ribonucleic acid molecule for
cancer; ovarian cancer; melanoma; lymphoma; glioma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

This linker is part of a pair which is attached to the N-terminal of a fragment contg. the human interferon alpha-1 gene. A 207 bp prod. with a BamHi terminal is the result. This provides fer matching to expression regulatory signals and, since 2 promoters can be incorporated into the final vector, a high level of expression is obtained. The 5' end of the complementary strand by GAYC. The 5' end of the complementary strand by GAYC. The 5' end of the complementary strand of the sense strand by GTAG. This invention describes a novel non-MRL healer mouse (M) having at least one quantitative trait locus selected from those given in the specification, exhibiting an enhanced healing response to a wound compared to mice (M) without the locus. The invention describes a novel method of identifying a gene involved in enhanced wound healing by identifying DNA microsatellite markers which can distinguish healer mice from non-healer mice and identifying microsatellite markers which can conform the enhanced wound healing in progeny of the mice, where a chromosomal locus contraining at least one enhanced wound healing gene is identified. A method of treating a wound in a mammal is also disclosed. The new methods are useful for treating wounds, especially central and conformation after nerve injury in a mammal is also disclosed. The new methods for wound healing, useful for identifying genes a mammalian model of enhanced wound healing, useful for identifying genes cand gene products involved in enhanced wound healing, and to provide methods for wound healing. AAZ18691-Z19036 represent murine SAGE tags from GS7BL/6 and MRL mice which are used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel CYP3A5 polynucleotide useful for diagnosis and treatment of cancer, cardiovascular diseases, diabetes and AIDS, and for identifying polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, CYP3A5, polymorphism, cancer, cardiovascular disease, diabetes, AIDS, African American, forensic marker, pharmacological, cytostatic, antidiabetic, anti-HIV, gene therapy, ds.

                             polypeptide, where the polymocleotide is capable of hybridishing to a CYPAS gene. The invention is useful in an in vitro method for diadentifying a polymorphism. The invention is also useful for useful for diagnosing a disorder related to the presence of a molecular variant of a CYPAS or susceptibility to such a disorder, where the disorder is cancer, or diseases including cardiovascular diseases, diabetes and AIDS. The invention can further be used for the preparation of a diagnostic composition for diagnosing a disease in a subject having a genome comprising a variant allele of the CYPAS gene, where the subject is an African American. The molecules of the invention are as forensic markers and in pharmacological studies. The present nucleic acid sequence represents a human CYPAS gene polymorphism variant DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A DNA chip was prepared for analysing sequences contained in a 1.3kb fragment of human mitochondrial DNA from the D-loop region, the most polymorphic region of human mitochondrial DNA. The chip comprised a set

The primer sequences are generated by stimulating PCR reactions on nonredundant mammalian nucleotide sequence databank entries containing at least 1,000 bp of coding region. The primers selected, such as the present one, had to meet various criteria such as having an efficiency index between 2-10, having a selectivity index higher than 1, being 12 pp long i.e. 8 C or G and 4 T or A, and each primer differed from the others in at least 5 of the 8 bases at the 3'-end. The invention claims the selected primers make it possible to use internally primed, PCR-based RNA fingerprinting for simple, exhaustive and systematic analysis of
of 268 overlapping oligonucleotide probes (see AAQ88421-Q88684) of varying length (9-14 nucleotides) with varying overlaps arranged in a lom x clm array. Each position in the sequence was represented by at least one probe (usually 2 or more). DNA was amplified from six human donors and then transcribed to give the 1.3kb RNA transcripts which were hybridised to the chip. For each individual, a unique hybridisation fingerprint was produced on the chip; all differences could be correlated with differences in the cloned genomic DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Differential screening of gene expression by reverse transcription polymerase chain reaction – uses random priming with primers selected for high efficiency and selectivity by computer screening of database(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RT-PCR; primer; amplification; reverse transcription; RNA fingerprinting;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The method can also be useful for isolating new

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contran envious system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI32073 tapeseen the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method of identifying target genes, for use in anti-infective treatments, in a microorganism, involving obtaining antisense peptide nucleic acid (PNA) sequences for potential target genes, mixing them with the organism in culture and comparing the growth in the presence and absence of the antisense PNA sequence, where a useful target gene is one which results in decreased growth when blocked by the antisense sequence. Antisense oligonucleotides are linked to cationic peptides via a linking group for use as antimicrobial compounds, particularly as antibioties. The present sequence is an oligonucleotide useful as the antisense portion of a PNA in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying target genes in a microorganism (e.g. Escherichia coli) as a basis for anti-infective treatment comprises selecting potential targets known to be present and obtaining complementary (antisense) peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /*tag* a

                                                                                                                                                                                                                                                                                                                                                        This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF9989, ABF00010-ABF9989, ABF00010-ABF9989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
central nervous system; gastrointestinal; respiratory; immune; metabolic.

Producing a small, interfering RNA (siRNA) by providing a first or second RNA construct comprising a first or second ribozyme operably linked to a sense or an antisense strand, respectively of an siRNA.
                                                                                                                                                                                                                                                                      This invention relates to a novel method of producing a small interfering RNA (siRNA). The method comprises providing a first RNA construct comprising a first ribozyme operably linked to a sense and antisense strand of an siRNA and placing the first and second RNA constructs under conditions where the first and second ribozyme catalyze the cleavage of the sense and antisense strands of the siRNA from the first and second RNA constructs used during the exemplification of the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New stable oligo:nucleotide duplex with 3'-steroid gp - including intramolecular duplex with hairpin loop region, having selective cytotoxicity against some tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

New oligonucleotides are disclosed which are 8-18 nucleotides in length and which have a steroid structure attached to the 3'-end through a linker attached to the A-ring of the steroid skeleton. In particular, the present sequence has a cholesteroid noiety attached by its A-ring to to the 3'-phosphate through a carbonyl group attached to the ring nitrogen of a moiety derived from 4-hydroxy-2-hydroxymethyl- pyrrolidine. The oligonucleotides form stable duplexes at physiological temperature and have selective cytotoxic activity against certain tumour cell lines, including some with multiple drug resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New oligonucleotides are disclosed which are 8-18 nucleotides in length and which have a steroid structure attached to the 3'-end through a printer attached to the A-ring of the steroid skeleton. In particular, the present sequence has a cholesterol moiety attached by its A-ring to to the 3'-phosphate through a carbonyl group attached by its A-ring to to of a moiety derived from 4-hydroxy-2-hydroxymethyl- pyrrolidine. The oligonucleotides form stable duplesses at physiological temperature and have selective cytotoxic activity against certain tumour cell lines, including some with multiple drug resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New stable oligo:nucleotide duplex with 3'-steroid gp - including intramolecular duplex with hairpin loop region, having selective cytotoxicity against some tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Steroid, anticancer, antitumour; cytotoxic; duplex; linker; multiple drug resistance; MDR; ss.

The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                           New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular
                                          Human, transcriptome, gene expression pattern; cancer; drug screening; cancer diagnosis; cell specific gene expression; ss.
             Human colon epithelium specific transcriptome sequence SEQ ID NO: 64.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
```

```
The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate cell; and (b) monitoring expression of a NORF gene whose expression of antifungal drugs comprising: (a) contacting a test substance which a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (b) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and expression is a flected by the class of thugs. The NORF genes may be used to identify candidate drugs which affect the cell cycle the cell cycle the cell cycle as expressed may be used to identify candidate drugs. The NORF genes may be used to identify candidate drugs. The NORF genes may be used to identify candidate drugs. The NORF genes may be used to identify candidate drugs. Which affect the cell cycle the present invention.
                                                                                                                       Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      linkers and PCR primers used in the SAGE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Yeast, Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonannotated ORF; SAGE; serial analysis of gene expression; antifungal; tag; identification; linker; PCR primer; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

```
The invention relates to genotyping human galanin receptor (GALRI) gene of an individual, involving determining for the two copies of the GALRI Come or more polymorphic sites. The method is useful for determining come or more polymorphic sites. The method is useful for determining come or more polymorphic sites. The method is useful for determining come or more polymorphic sites. The method is useful for determining come or more polymorphic sites. The method is useful for determining come or more polymorphic sites. The method is useful for determining come specification. This is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with GALRI activity, and in the dealgn of clinical trials of candidate drugs compared compared to the associated with GALRI activity, and in the dealgn of clinical trials of candidate drugs compared to the associated with GALRI activity. The method is useful to screen for compounds targeting GALRI to treat a specific conditions or disease associated with GALRI activity. The method is useful to screen for compounds the expression and function of GALRI, and in expressing GALRI protein for use in screening for candidate drugs to treat diseases related to GALRI activity. The polymucleotide or variant is useful for studying expression of the biological activity of GALRI as well as on the binding confituined for studying the effect of the variation on the biological activity of GALRI as well as on the binding confituined for studying the method of the formal for the method of the formal f
                                                                                                                                                                                                                                                                                                                   Genotyping human galanin receptor gene of an individual for determining haplotype of an individual, involves determining the identity of nucleotide pair at specific polymorphic sites for two copies of the gene
                                                                                                                                                                                                         Nandabalan K;

Primer #27 to detect human PI4 gene polymorphisms.

26-MAR-2002 (first entry)

Human, protease inhibitor, PI4; kallistatin, therapy, polymorphic site, PS; haplotyping, genotyping, acute pancreatitis, drug screening; antiinflammatory; chromosome 14q31-q32.1; primer; ss.

Homo sapiens

WO200179227-A2

```
(Kallistatin) gene of an individual, involves determining for the two copies of the PI4 gene present in the individual, the identity of the nucleotide pair at one or more polymorphic sites. PI 4 gene is located on chromosome 14431-432.1. Genotyping is useful for determining if an individual has a haplotype or haplotype pairs defined in the specification. Haplotype or haplotype pairs defined in the factory and development of drugs for treating diseases associated with PI4 activity, e.g. acute pancreating diseases associated with PI4 activity, e.g. acute pancreating, to validate PI4 as a candidate agent for treating a specific condition or disease predicted to be associated with PI4 activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with PI4 activity. The PI4 gene is useful in studying the expression and function of PI4, and in expressing PI4 protein for use in screening for candidate drugs to treat diseases related to PI4 activity. The present
                                                                                                                                                                                                                  Genotyping protease inhibitor 4 gene of individual for determining haplotype of individual, involves determining identity of nucleotide pair at specific polymorphic sites for two copies of gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Selectin L Lymphocyte Adhesion Molecule 1 (SELL) oligonucleotide #83.
                                                                                                                                                                                                                                                                                                                                   The present invention relates to genotyping protease inhibitor (PI) 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequence is a primer to detect human PI4 gene polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; Selectin L Lymphocyte Adhesion Molecule 1; SELL;

The invention relates to an isolated polynuciatoride (I) comprising a neclectide sequence which is a polynucibit variant of a reference sequence for Selectin L Lymphocyte Adhesion Molecule 1 (SELI) gene. SELL polypeptide is useful for screening for drugs targething the polypeptide. Oligonuclectides derived from (I) are used to target SELL and a haplotype or haplotype pair of SELL gene. These are useful in developing diagnostic creates and therapeutic treatments for neonatal pertuesis (whooping cough). (I) is useful for studying the expression and function of SELL and adact diseases related to SELL activity. The polymorphism and haplotype or reat whooping cough, screening for such drugs and reducing bias in creat whooping cough, screening for such drugs and reducing bias in creat whooping cough, screening for such drugs and reducing bias in clinical trials of such drugs. Establishing the SELL haplotype or haplotype pair of an individual is useful for improving the efficiency and reliability of several steps in the discovery and development of creat whooping cough). The haplotyping method is useful to disease pertusis (whooping cough). The haplotyping method is useful to disease predicted to be associated with SELL activity, e.g. detecting or disease predicted to be associated with SELL activity, e.g. detecting which of the SELL haplotype plant or disease predicted to be associated with SELL activity, e.g. detecting which of the SELL haplotype plants present in individual cream or disease predicted to be associated with SELL activity, e.g. detecting which of the appoint of the most frequent SELL isoforms present to neces for compounds that display the highest desired agonist or antagonist activity for each of the most frequent SELL isoforms present controlling affinity of candidate drugs targeting SELL is useful in structured the binding affinities of one or more candidate drugs targeting the effect of the variation on the binding affinities of one or accompanial activity of series of the binding affinities of on Human; CD-39-like protein; CD39L2 protein; therapy; immune deficiency; autoimmune disorder; multiple sclerosis; systemic lupus erythematosus; rheumatoid arthritis; autoimmune thyroiditis; allergic reaction; asthma; insulin dependent diabetes mellitus; periodontal disease; osteoporosis; osteoarthritis; wound healing; tissue repair; Alzheimer's disease; ulcer; Parkinson's disease; nerve injury; isclerosis; Huntington's disease; nerve injury; isclerosis; Huntington's disease; endocoxin lethality; arthritis; nephritis; inflammatory bowel disease; Crohn's disease; virucide; antibacterial; antifungal; neuroprotective; Gaps The invention relates to an isolated polynucleotide (I) comprising a Novel genetic variants of selectin L lymphocyte adhesion molecule 1 (SELL) gene useful for therapeutic purposes and for expressing SELL protein useful in identifying drugs to treat whooping cough. ö Kliem SE, Koshy B, Kumar AM 42.0%; Score 8.4; DB 1; Length 10; 90.0%; Pred. The present invention relates to novel proteins with phosphohydrolase activity, designated CD-39-like (CD39L) proteins and polynucleotides activity, designated CD-39-like (CD39L) proteins are useful to treat infectious (diseases caused by viral, bacterial, fungal or other infections and diseases caused by viral, bacterial, fungal or other infections may be treatable with CD39L. They are useful in the treatment of various can disease and disorders, autoimmune disorders such as multiple sclarosis, aystemic lupus erythematosus, rheumatoid arthritis, autoimmune thyroiditis and insulin dependent disbetes mellitus, allergic reactions and conditions such as asthms and other respiratory problems, periodontal disease, osteoporosis, osteoarthrifis and other tooth repair processes.

They may have utility in compositions used for bone, cartilage, tendon, lagament and/or nerve tissue growth or regeneration as well as for wound healing and tissue repair and replacement and in the treatment of burns, incisions and ulcers. CD39L proteins may also be useful for proliferation, the treatment of central nervous system diseases uch as Alzheimer's disease, parkinson's disease, amyotrophic lateral sclerosis, Huntington's disease, parkinson's disease, amyotrophic lateral sclerosis, Huntington's peripheral neuropathy and localised neuropathies. They are also useful to promote better or faster closure of nonchalling wounds, including pressure ulcers, ulcers associated with any are also useful to promote better or faster closure of nonchalling wounds, including pressure ulcers, ulcers associated with a stiff and for a marrial and traumatic disorders which the anisating wounds, including pressure ulcers, ulcers associated with exhibit anti-inflammatory activity and may be used to treat inflammatory conditions including chronic or acute conditions), including ischaemia-reperfusion injury, endotoxin lethality, arthritis, nephritis, cytokine or chemokine-induced lung injury, inflammatory bowel disease or Crohn's disease. The present sequence is human CD39L2 initiation start site An isolated polypeptide with phosphohydrolase activity, designated CD39L2, useful to identify other proteins with which binding occurs or identify inhibitors and for treatment of, e.g., Alzheimer's, multiple Sequence 10 BP; 5 A; 1 C; 3 G; 0 T; 1 U; 0 Other; Example; Col 56; 101pp; English. sclerosis and osteoporosis. Novel polynucleotide containing polymorphisms in intercellular adhesion molecule 2 gene, useful in developing drugs for treating human immunodeficiency virus infection and inflammatory diseases.

Claim 18; Page 14; 81pp; English.

The invention relates to single nucleotide polymorphisms in the gene encoding human intercellular adhesion molecule 2 (ICAM2). A method for haplotyping the ICAM2 gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the ICAM2 haplotypes given in the specification or whether both copies are defined by a haplotype pair. In genetyping, whereby all possible haplotype pairs can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype pair of the laplotype or haplotype pair of the haplotype or haplotype pair of the haplotype or haplotype haplotype haplotype or haplotype haplotype haplotype haplotype haploty specific oligonucleotide probes, sequencing primers, PCR primers and cDNA encoding human ICAM2

The invention relates to SAGE (serial analysis of gene expression) tags
representing groups of genes which are differentially expressed in human
creating groups of genes which are differentially expressed in human
creating groups of genes which are differentially expressed in human
creating groups of genes which normal human liver tissue.

The SAGE tags of this invention consist of a sequence of 10 nucleotides
concated downstream of the 5'-CATG-3' sequence motif lying nearest to the
colya region of cDNAs derived from a variety of genes. These tags serve
to uniquely identify each transcript and can thus be used to analyse the
colya region of cDNAs derived from a variety of genes. The invention also
crelates to proteins encoded by the genes expressed in chronic hepatitis C liver tissue or HCC, antibodies against these proteins, and inhibitors of
the expression of groups of genes that are overexpressed in chronic
chepatitis C liver tissue or HCC. Groups of genes differentially expressed
in chronic hepatitis C tissue or HCC may be used for the diagnosis and
creatment of these diseases. Such genes, inhibitors of their expression
or activity, and antibodies against the gene products may be used in the
development of drugs to treat chronic hepatitis C and/or HCC. Sequences
ABV84191-ABV8420 are SAGE tags representing the 100 most highly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human chronic hepatitis C tissue expression exasperating gene group comprises 100 high-ranking genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           representing groups of genes which are differentially expressed in human chronic hepatitis C (CH) liver tissue or hepatitis C-induced chronic hepatitis C (CH) liver tissue or hepatitis C-induced chronic hepatitis C (CH) liver tissue or hepatitis C-induced in human located downstream of the 5'-CATG-3' sequence motif lying nearest to the colyA region of CDNNA derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also the expression of groups of genes expressed in chronic hepatitis C liver tissue or HCC, antibodies against these proteins, and inhibitors of the expression of groups of genes that are overexpressed in chronic hepatitis C liver tissue or HCC groups of genes differentially expressed in chronic hepatitis C tissue or HCC may be used for the diagnosis and treatment of these diseases. Such genes, inhibitors of their expression or activity, and antibodies against the gene products may be used in the development of drugs to treat chronic hepatitis C and/or HCC. Sequences ANDW4691-ABN84790 are SAGE tags representing the 100 least highly hear the control of those genes which are underexpressed in the control of those sour of those genes which here is the control of those spressenting the loo least highly the control of those spressenting the loo least highly the control of those spressenting the loo least highly the control of those spressenting the loo least highly the control of the contro

The invention relates to single nucleotide polymorphisms in the human apolipoprotein C1 (APOC1) gene. Haplotyping the APOC1 gene of an individual, comprises determining if the individual has one of the APOC1 haplotype pairs fully defined in the specification.

Genotyping the APOC1 gene of an individual, comprises determining the clentity of the nucleotide pair at one or more polymorphic sites and predicting a haplotype pair for the APOC1 gene of an individual by connecrating all possible haplotype pairs which are consistent with the genotype, comparing the possible haplotype pairs which are consistent with the data. Identifying an association between a trait and a haplotype or haplotype pair is consistent with that of a reference population, where the individual that the trait with that of a reference population, where the haplotype pair is one described in the specification and a haplotype pair is one described in the specification and a haplotype pair is one described in the specification and a haplotype pair is one described in the specification and a haplotype pair is one described in the specification and a haplotype pair so haplotype. The sequences and methods of the invention are used to diagnose and develop treatment for disease associated with APOC1 activity, such as hypercholesteroleemia and semile dementia of the APOC1 activity, and a hypercholesteroleemia and semile dementia of the APOC1 activity happen the sequence represents a PCR primer used for
                                                                                                                                                                                                      New haplotypes of the human apolipoprotein Cl gene, useful to detect and find treatment for disease associated with its activity such as hypercholestrolemia and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human; cholesteryl ester transfer protein; CETP;
